

OSBORNE[®]

The Osborne Pivot Feeder[™]

Ad-libitum Sow Feeder

HOW IT WORKS: As the sow moves the lever of the feeder to one side of the bowl, a small cup inside the hopper is filled with feed. When the lever is moved to the opposite side, feed is dispensed into the bowl. The feeder dispenses an equal amount of fresh feed on each rotation or "pivot". Sows must eat feed in the bowl before they are allowed to dispense more, preventing feed from accumulating in the bowl and increasing feed savings. The Pivot Feeder dispenses feed ad-libitum, increasing intake and optimizing sow condition.

* **Easy to Clean**

Feed tube removes easily and feeder is cleaned with the bowl.

* **Refill Automatically**

Hopper opening accepts standard feed drop tubes from an automatic feed delivery system. A hopper kit with 24-lb. capacity is also available.

* **Economical**

No need to buy new bowls. This rugged feeder easily retro-fits to your existing bowls, and installs even with the sow in the stall!

* **Fresh Feed Always**

An equal amount of feed is dispensed on each "pivot" distributing feed uniformly in the bowl.

* **Customizable**

Pick the lever option that perfectly matches your existing bowl configuration.

* **Feeding Options**

The trigger point is at the lever, keeping wet snouts away from the Pivot Feeder. Wet/dry feeding works because the feeder remains dry.

* Display stand, PVC drop tube and sow bowl not included.

Multiple lever options

Equal dispensing on each rotation

24-lb. capacity plastic hopper kit available
